3.10 Flow Model

- Maximum/Minimum flow with lower bound / Circulation problem
- 1. Construct super source S and sink T .

- 2. For each edge (x, y, l, u) , connect $x \rightarrow y$ with capacity $u - l$.
- 3. For each vertex v , denote by $in(v)$ the difference between the sum of incoming lower bounds and the sum of outgoing lower bounds.
- 4. If $in(v) > 0$, connect $S \rightarrow v$ with capacity $in(v)$, otherwise, connect $v \rightarrow T$ with capacity $-in(v)$.
 - To maximize, connect $t \rightarrow s$ with capacity ∞ (skip this in circulation problem), and let f be the maximum flow from S to T . If $f \neq \sum_{v \in V, in(v) > 0} in(v)$, there's no solution. Otherwise, the maximum flow from s to t is the answer.
 - To minimize, let f be the maximum flow from S to T . Connect $t \rightarrow s$ with capacity ∞ and let the flow from S to T be f' . If $f + f' \neq \sum_{v \in V, in(v) > 0} in(v)$, there's no solution. Otherwise, f' is the answer.
- 5. The solution of each edge e is $l_e + f_e$, where f_e corresponds to the flow of edge e on the graph.
- Construct minimum vertex cover from maximum matching M on bipartite graph (X, Y)
 1. Redirect every edge: $y \rightarrow x$ if $(x, y) \in M$, $x \rightarrow y$ otherwise.
 2. DFS from unmatched vertices in X .
 3. $x \in X$ is chosen iff x is unvisited.
 4. $y \in Y$ is chosen iff y is visited.
- Minimum cost cyclic flow
 1. Construct super source S and sink T
 2. For each edge (x, y, c) , connect $x \rightarrow y$ with $(cost, cap) = (c, 1)$ if $c > 0$, otherwise connect $y \rightarrow x$ with $(cost, cap) = (-c, 1)$
 3. For each edge with $c < 0$, sum these cost as K , then increase $d(y)$ by 1, decrease $d(x)$ by 1
 4. For each vertex v with $d(v) > 0$, connect $S \rightarrow v$ with $(cost, cap) = (0, d(v))$
 5. For each vertex v with $d(v) < 0$, connect $v \rightarrow T$ with $(cost, cap) = (0, -d(v))$
 6. Flow from S to T , the answer is the cost of the flow $C + K$
- Maximum density induced subgraph
 1. Binary search on answer, suppose we're checking answer T
 2. Construct a max flow model, let K be the sum of all weights
 3. Connect source $s \rightarrow v, v \in G$ with capacity K
 4. For each edge (u, v, w) in G , connect $u \rightarrow v$ and $v \rightarrow u$ with capacity w
 5. For $v \in G$, connect it with sink $v \rightarrow t$ with capacity $K + 2T - (\sum_{e \in E(v)} w(e))$
 6. T is a valid answer if the maximum flow $f < K|V|$
- Minimum weight edge cover
 1. Let $w'(u, v) = w(u, v) - \mu(u) - \mu(v)$, where $\mu(v)$ is the cost of the cheapest edge incident to v .
 2. Find the minimum weight matching M with w' . The answer is $\sum \mu(v) + w'(M)$.
- Project selection problem
 1. If $p_v > 0$, create edge (s, v) with capacity p_v ; otherwise, create edge (v, t) with capacity $-p_v$.
 2. Create edge (u, v) with capacity w with w being the cost of choosing u without choosing v .
 3. The mincut is equivalent to the maximum profit of a subset of projects.
- Dual of minimum cost maximum flow
 1. Capacity c_{uv} , Flow f_{uv} , Cost w_{uv} , Required Flow difference for vertex b_u .
 2. If all w_{uv} are integers, then optimal solution can happen when all p_u are integers.

$$\begin{aligned} \min \sum_{uv} w_{uv} f_{uv} \\ -f_{uv} \geq -c_{uv} \Leftrightarrow \min \sum_u b_u p_u + \sum_{uv} c_{uv} \max(0, p_v - p_u - w_{uv}) \\ \sum_v f_{vu} - \sum_v f_{uv} = -b_u \end{aligned}$$

6.5 Simplex Construction

Standard form: maximize $\sum_{1 \leq i \leq n} c_i x_i$ such that $\sum_{1 \leq i \leq n} A_{ji} x_i \leq b_j$ for all $1 \leq j \leq m$ and $x_i \geq 0$ for all $1 \leq i \leq n$.

1. In case of minimization, let $c'_i = -c_i$
2. $\sum_{1 \leq i \leq n} A_{ji} x_i \geq b_j \rightarrow \sum_{1 \leq i \leq n} -A_{ji} x_i \leq -b_j$
3. $\sum_{1 \leq i \leq n} A_{ji} x_i = b_j \rightarrow \text{add } \leq \text{ and } \geq$
4. If x_i has no lower bound, replace x_i with $x_i - x'_i$

6.6 LP Dual

$$\max \sum_{i \in [n]} c_i x_i \Leftrightarrow \min \sum_{j \in [m]} b_j y_j$$

$$\begin{array}{ll} \sum_{i \in [n]} a_{ji} x_i \leq b_j \Leftrightarrow y_j \geq 0 & x_i \geq 0 \Leftrightarrow \sum_{j \in [m]} a_{ji} y_j \geq c_i \\ \sum_{i \in [n]} a_{ji} x_i \geq b_j \Leftrightarrow y_j \leq 0 & x_i \leq 0 \Leftrightarrow \sum_{j \in [m]} a_{ji} y_j \leq c_i \\ \sum_{i \in [n]} a_{ji} x_i = b_j \Leftrightarrow y_j \in \mathbb{R} & x_i \in \mathbb{R} \Leftrightarrow \sum_{j \in [m]} a_{ji} y_j = c_i \end{array}$$

$$\max c^\top x \text{ subject to } Ax \leq b, x \geq 0 \Leftrightarrow \min b^\top y \text{ subject to } A^\top y \geq c, y \geq 0$$

$$\sum_i c_i x_i \leq \sum_i (\sum_j a_{ji} y_j) x_i = \sum_j (\sum_i a_{ji} x_i) y_j \leq \sum_j b_j y_j$$

Complementary slackness:

- Primal: $\forall i, x_i = 0 \vee c_i = \sum_j a_{ji} y_j$
- Dual: $\forall j, y_j = 0 \vee b_j = \sum_i a_{ji} x_i$

Lagrange's Inversion Formula

如果 F 跟 G 互反，則有 $F(0), G(0) = 0, F'(0), G'(0) \neq 0$ 。若 H 為任意 FPS，則

$$n[x^n]G(x) = [x^{n-1}] \frac{1}{(F(x)/x)^n}$$

$$n[x^n]H(G(x)) = [x^{n-1}] H'(x) \frac{1}{(F(x)/x)^n}$$

Newton's iteration

如果有 $F(G(x)) = 0$ 已知 F 則可以用 $G_2 N(x) = G_N(x) - F(G_N(x)) / \frac{\partial F}{\partial P}(G_N(x))$ 求出 G 的前 N 項，其中 P 代表多項式。

9.2 Matroid

$M = (E, \mathcal{I})$, where $\mathcal{I} \subseteq 2^E$ is nonempty, is a matroid if:

- If $S \in \mathcal{I}$ and $S' \subseteq S$, then $S' \in \mathcal{I}$.
- For $S_1, S_2 \in \mathcal{I}$ s.t. $|S_1| < |S_2|$, there exists $e \in S_2 \setminus S_1$ s.t. $S_1 \cup \{e\} \in \mathcal{I}$.

Matroid intersection:

Start from $S = \emptyset$. In each iteration, let

- $Y_1 = \{x \notin S \mid S \cup \{x\} \in \mathcal{I}_1\}$
- $Y_2 = \{x \notin S \mid S \cup \{x\} \in \mathcal{I}_2\}$

If there exists $x \in Y_1 \cap Y_2$, insert x into S . Otherwise for each $x \in S, y \notin S$, create edges

- $x \rightarrow y$ if $S - \{x\} \cup \{y\} \in \mathcal{I}_1$.
- $y \rightarrow x$ if $S - \{x\} \cup \{y\} \in \mathcal{I}_2$.

Find a *shortest path* (with BFS) starting from a vertex in Y_1 and ending at a vertex in Y_2 which doesn't pass through any other vertices in Y_2 , and alternate the path. The size of S will be incremented by 1 in each iteration. For the weighted case, assign weight $w(x)$ to vertex x if $x \in S$ and $-w(x)$ if $x \notin S$. Find the path with the minimum number of edges among all minimum length paths and alternate it.
